

Faster denial appeals, with a record of who approved what.

For medical billing and revenue cycle teams working US payer denials.

Appeal Desk turns a payer denial letter into a reviewed, ready-to-send appeal draft, and keeps a tamper-evident record of every step. The software drafts. A named person on your team decides.

The problem it addresses

- Appeals are written by hand, one letter at a time, against payer deadlines that are easy to miss.
- As teams start using AI, US clients are beginning to ask who checked the output and whether that can be shown.
- Patient information should travel no further than it needs to.

How it works

What your team sees

- **Warnings up front:** appeal deadlines that are close or passed, high-value claims, and timely-filing denials that are often unrecoverable.
- **A draft for each denial type,** with a checklist of the documents to attach.
- **Placeholders, not guesses:** wherever a clinical or billing fact is not in the letter, the draft says *[ADD: ...]* for the reviewer to fill in.
- **A printable audit report** for each case: the claim, the final letter, who approved it and when, and whether they edited the draft.

Built-in safeguards

Safeguard	What it means in practice
The software never decides	It cannot approve, deny or submit anything. It only prepares a draft.
A named human is required	No approval, escalation or discard is recorded without a reviewer name.
Identifiers removed before AI	In AI-assisted configurations, only de-identified letter text is sent to the AI model. Names, member IDs and dates of birth are restored locally in the draft.
Fails safe on unclear letters	If no patient name field is found, the letter is not sent to the AI at all, and the screen shows a red warning.
No invented facts	Drafts use placeholders for anything not present in the letter.
Tamper-evident record	Each audit entry carries a SHA-256 fingerprint that includes the previous entry. Changing an old entry breaks the chain and is flagged.

Denial types covered out of the box

Code	Category and approach
CO-50	Medical necessity: formal clinical appeal with peer-to-peer request
CO-16	Missing or invalid information: corrected-claim cover note
CO-29	Timely filing: appeal with proof of original submission
CO-97	Bundled service: separate-and-distinct documentation and modifier support

Other codes are flagged for senior review. A pilot can add the denial types that matter most to your team.

What Appeal Desk is not. It does not submit appeals to payers, does not make coverage or clinical decisions, and does not replace your billers. It is not a HIPAA certification, and using it does not by itself make a workflow compliant. See the Trust and Data Handling sheet for what it does and does not do today.

See it and try it

The attached live demo runs entirely in your browser with synthetic letters. Nothing you type is sent anywhere. The demo drafts from built-in templates; a pilot on your own redacted letters is the next step.
